

Health Care Reform Defined

OK-SAFE, Inc.

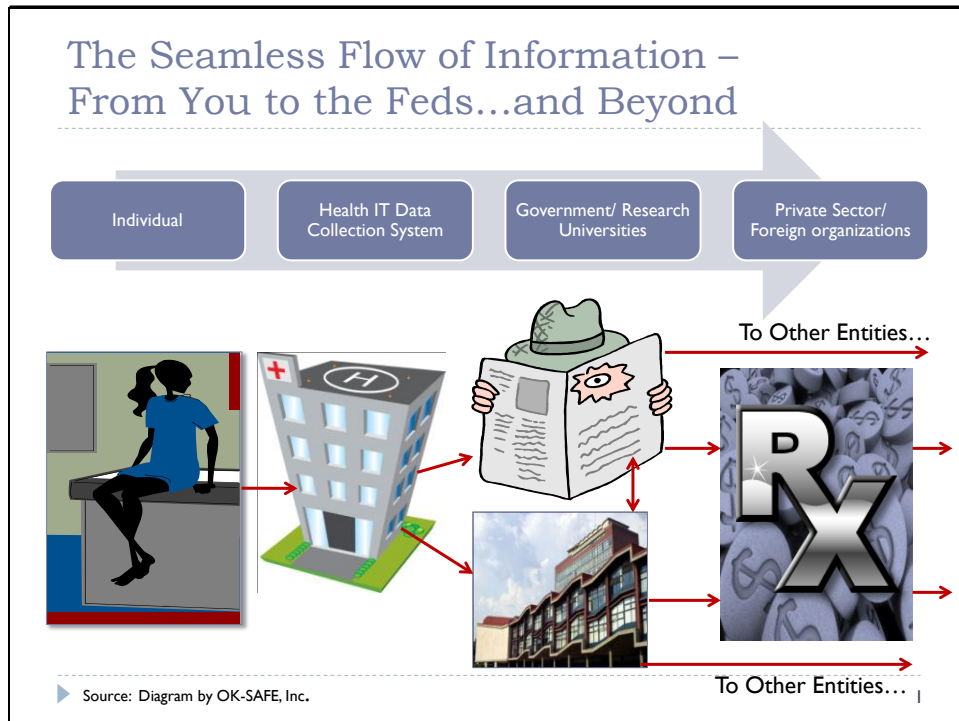

The American public has been misled about what health care reform in the United States actually means and what it entails. Health care reform is not about healing sick people, nor is it about “savings lives and saving dollars” as we have been led to believe.

Health care reform is really about replacing our traditional medical system with a non-human technology-based, universal health care system; one that is interoperable with those systems in foreign countries.

This type of reform replaces real doctors with virtual doctors; globally shares our most intimate medical and health information (including conversations with the doctor, “mental health” counseling, and information about lifestyle and lifestyle choices) with people we don’t even know, and severs the once-confidential relationship between patients and doctors. Americans’ highly personal information used to be considered private and inviolate.

It is a technological reform that enables the interfacing of your medical and health data with your education records, as well as with your banking and employment records. And all of it links to the federal government.

Health care reform didn’t start with the election of the president in 2008. It began in the Clinton administration, continued through the Bush years, and culminated with the election of the next president, who happened to be Obama.

OK-SAFE, Inc. – Health Care Reform Defined

The Real Definition of Health Care Reform:

- **Health Care Reform** - The adoption and use of IT (information technology) to implement a nationwide health information network (NHIN), that enables the seamless flow of information across institutional and jurisdictional boundaries, and that allows the growing *global* surveillance system to function.
- **Electronic Health Records** - Reform is predicated on the creation of a standardized, interoperable electronic health record (EHR) on every single individual
- **Cradle-to-Grave** - EHRs are used for data collection, aggregation and reporting and are intended to track a person from birth to death. (Longitudinal)
- **EHRs are universal and to be shared globally** - not only within our government, but with foreign governments, universities, and other third parties.
- **Requires Standardization and Interoperability** - Common standards establish uniformity and compatibility in data collection, regardless of jurisdiction and allow for interoperability of disparate systems
- **EHRs include each person's genetic information** - This will be used for research purposes, without the knowledge or consent of the individual
- **Rights killing** - Health care reform, and other data collection networks, do an “end-run” around search warrants, and nullify our inherent rights to life, liberty and property.

Action Items:

This non-human, technology-based universal health care system was and is supported in this state by Governors Henry and Fallin, along with the majority of the Oklahoma Legislature.

Will you help us stop this in Oklahoma?

Contact your state elected officials and tell them you want no part of this system.

Demand that they repeal these three enabling pieces of legislation: [SB 1420](#) (from 2008), [SB 757](#) (from 2009), and [SB 1373](#) (from 2010). Inform them that they have no right to make the people of Oklahoma participate in any information sharing system without their fully-informed consent or knowledge.
